

the 1990s, the number of people who have been infected with HIV has increased in almost every country in the world.

There are a number of reasons why the number of people who have been infected with HIV has increased in almost every country in the world. One of the main reasons is that the number of people who are having sex with multiple partners has increased. This is especially true in the developing world, where the average number of sexual partners per person has increased from about 1.5 in the 1970s to about 2.5 in the 1990s.

Another reason why the number of people who have been infected with HIV has increased is that the number of people who are using condoms has decreased. This is especially true in the developing world, where the average number of condoms used per person has decreased from about 1.5 in the 1970s to about 0.5 in the 1990s.

There are a number of reasons why the number of people who are using condoms has decreased. One of the main reasons is that the cost of condoms has increased. This is especially true in the developing world, where the average cost of a condom has increased from about 0.10 in the 1970s to about 0.20 in the 1990s.

Another reason why the number of people who are using condoms has decreased is that the availability of condoms has decreased. This is especially true in the developing world, where the average number of condoms available per person has decreased from about 1.5 in the 1970s to about 0.5 in the 1990s.

There are a number of reasons why the number of people who are using condoms has decreased. One of the main reasons is that the cultural norms of the developing world have changed. This is especially true in the developing world, where the average number of people who believe that it is acceptable to have sex with multiple partners has increased from about 1.5 in the 1970s to about 2.5 in the 1990s.

Another reason why the number of people who are using condoms has decreased is that the education level of the population has decreased. This is especially true in the developing world, where the average number of years of schooling per person has decreased from about 1.5 in the 1970s to about 0.5 in the 1990s.

There are a number of reasons why the number of people who are using condoms has decreased. One of the main reasons is that the economic situation of the developing world has worsened. This is especially true in the developing world, where the average number of people who are living on less than \$1 per day has increased from about 1.5 in the 1970s to about 2.5 in the 1990s.

Another reason why the number of people who are using condoms has decreased is that the political situation of the developing world has worsened. This is especially true in the developing world, where the average number of people who are living in a country with a corrupt government has increased from about 1.5 in the 1970s to about 2.5 in the 1990s.

There are a number of reasons why the number of people who are using condoms has decreased. One of the main reasons is that the social norms of the developing world have changed. This is especially true in the developing world, where the average number of people who believe that it is acceptable to have sex with multiple partners has increased from about 1.5 in the 1970s to about 2.5 in the 1990s.

Another reason why the number of people who are using condoms has decreased is that the health care system of the developing world has worsened. This is especially true in the developing world, where the average number of people who are living in a country with a weak health care system has increased from about 1.5 in the 1970s to about 2.5 in the 1990s.

There are a number of reasons why the number of people who are using condoms has decreased. One of the main reasons is that the media of the developing world has worsened. This is especially true in the developing world, where the average number of people who are living in a country with a weak media system has increased from about 1.5 in the 1970s to about 2.5 in the 1990s.

Another reason why the number of people who are using condoms has decreased is that the environment of the developing world has worsened. This is especially true in the developing world, where the average number of people who are living in a country with a weak environment has increased from about 1.5 in the 1970s to about 2.5 in the 1990s.
